Jonathan Le

October 15, 2022

Problem 1.1.   Let $x, y, z \in \mathbb{R}$

1. $\forall x \exists y \ \ s.t. \ \ x + y = 1$
True
Negation: $\neg(\forall x \exists y \ \ s.t. \ \ x + y = 1) = \exists x \forall y \ \ s.t. \ \ x + y \neq 1$

2. $\exists x \forall y \ \ s.t. \ \ x + y = 1$
True
Negation: $\neg(\exists x \forall y \ \ s.t. \ \ x + y = 1) = \forall x \exists y \ \ s.t. \ \ x + y \neq 1$

3. $\exists x \exists y \forall z \ \ s.t. \ \ yz = x$
True
Negation: $\neg(\exists x \exists y \forall z \ \ s.t. \ \ yz = x) = \forall x \forall y \exists z \ \ s.t. \ \ yz \neq x$

Problem 1.2.   Show that if a condition P is both necessary $(\overline{P} \Rightarrow \overline{Q})$ and sufficient $(P \Rightarrow Q)$, that this is logically equivalent to P = Q.

p	q	$p \Rightarrow q$	$\bar{p} \Rightarrow \bar{q}$	$(\bar{p} \Rightarrow \bar{q}) \wedge (p \Rightarrow q)$	$p = q$
1	1	1	1	1	1
1	0	0	1	0	0
0	1	1	0	0	0
0	0	1	1	1	1

Since $(\bar{p} \Rightarrow \bar{q}) \wedge p \Rightarrow q$ shares the same truth table as $p = q$, they are logically equivalent.

Problem 1.3.   Let c,d be two single digit numbers, $0 \leq c$, $d \leq 9$. We will create functions $f_1, f_2, f_3...$ that are as follows:

$$f_1(c, d) = cd$$
$$f_2(c, d) = cdcd$$
$$f_3(c, d) = cdcdcd$$
$$f_4(c, d) = cdcdcdcd$$
$$\vdots$$

For example, $f_3(4, 7) = 474747$, as we are repeating the digits 4,7, 3 times. Prove that $\forall 0 \leq c, d \leq 9, 37|f_9(c, d)$. In other words, prove that for any possible input into f_9, the output is divisible by 37.

Proof by exhaustion:

Let k be some number in $37k = 0$
$k = \frac{0}{37} = 0$, $k \in \mathbb{Z}$
$\therefore 37|0$

Let k be some number in $37k = 10101010101010101$
$k = \frac{10101010101010101}{37} = 273000273000273$, $k \in \mathbb{Z}$
$\therefore 37|10101010101010101$

Let k be some number in $37k = 20202020202020202$
$k = \frac{20202020202020202}{37} = 546000546000546$, $k \in \mathbb{Z}$
$\therefore 37|20202020202020202$

Let k be some number in $37k = 30303030303030303$
$k = \frac{30303030303030303}{37} = 819000819000819$, $k \in \mathbb{Z}$
$\therefore 37|30303030303030303$

Let k be some number in $37k = 40404040404040404$
$k = \frac{40404040404040404}{37} = 1092001092001092$, $k \in \mathbb{Z}$
$\therefore 37|40404040404040404$

Let k be some number in $37k = 50505050505050505$
$k = \frac{50505050505050505}{37} = 1365001365001365$, $k \in \mathbb{Z}$
$\therefore 37|50505050505050505$

Let k be some number in $37k = 60606060606060606$
$k = \frac{60606060606060606}{37} = 1638001638001638$, $k \in \mathbb{Z}$
$\therefore 37|60606060606060606$

Let k be some number in $37k = 70707070707070707$
$k = \frac{70707070707070707}{37} = 1911001911001911$, $k \in \mathbb{Z}$
$\therefore 37|70707070707070707$

Let k be some number in $37k = 80808080808080808$
$k = \frac{80808080808080808}{37} = 2184002184002184$, $k \in \mathbb{Z}$
$\therefore 37|80808080808080808$

Let k be some number in $37k = 90909090909090909$
$k = \frac{90909090909090909}{37} = 2457002457002457$, $k \in \mathbb{Z}$
$\therefore 37|90909090909090909$

Let k be some number in $37k = 101010101010101010$
$k = \frac{101010101010101010}{37} = 2730002730002730$, $k \in \mathbb{Z}$
$\therefore 37|101010101010101010$

Let k be some number in $37k = 111111111111111111$
$k = \frac{111111111111111111}{37} = 3003003003003003$, $k \in \mathbb{Z}$
$\therefore 37|111111111111111111$

Let k be some number in $37k = 121212121212121212$
$k = \frac{121212121212121212}{37} = 3276003276003276$, $k \in \mathbb{Z}$
$\therefore 37|121212121212121212$

Let k be some number in $37k = 131313131313131313$
$k = \frac{131313131313131313}{37} = 3549003549003549$, $k \in \mathbb{Z}$
$\therefore 37|131313131313131313$

Let k be some number in $37k = 141414141414141414$
$k = \frac{141414141414141414}{37} = 3822003822003822$, $k \in \mathbb{Z}$
$\therefore 37|141414141414141414$

Let k be some number in $37k = 151515151515151515$
$k = \frac{151515151515151515}{37} = 4095004095004095$, $k \in \mathbb{Z}$
$\therefore 37|151515151515151515$

Let k be some number in $37k = 161616161616161616$
$k = \frac{161616161616161616}{37} = 4368004368004368$, $k \in \mathbb{Z}$
$\therefore 37|161616161616161616$

Let k be some number in $37k = 171717171717171717$
$k = \frac{171717171717171717}{37} = 4641004641004641$, $k \in \mathbb{Z}$
$\therefore 37|171717171717171717$

Let k be some number in $37k = 181818181818181818$
$k = \frac{181818181818181818}{37} = 4914004914004914$, $k \in \mathbb{Z}$
$\therefore 37|181818181818181818$

Let k be some number in $37k = 191919191919191919$
$k = \frac{191919191919191919}{37} = 5187005187005187$, $k \in \mathbb{Z}$

$\therefore 37|191919191919191919$

Let k be some number in $37k = 202020202020202020$
$k = \frac{202020202020202020}{37} = 5460005460005460$, $k \in \mathbb{Z}$
$\therefore 37|202020202020202020$

Let k be some number in $37k = 212121212121212121$
$k = \frac{212121212121212121}{37} = 5733005733005733$, $k \in \mathbb{Z}$
$\therefore 37|212121212121212121$

Let k be some number in $37k = 222222222222222222$
$k = \frac{222222222222222222}{37} = 6006006006006006$, $k \in \mathbb{Z}$
$\therefore 37|222222222222222222$

Let k be some number in $37k = 232323232323232323$
$k = \frac{232323232323232323}{37} = 6279006279006279$, $k \in \mathbb{Z}$
$\therefore 37|232323232323232323$

Let k be some number in $37k = 242424242424242424$
$k = \frac{242424242424242424}{37} = 6552006552006552$, $k \in \mathbb{Z}$
$\therefore 37|242424242424242424$

Let k be some number in $37k = 252525252525252525$
$k = \frac{252525252525252525}{37} = 6825006825006825$, $k \in \mathbb{Z}$
$\therefore 37|252525252525252525$

Let k be some number in $37k = 262626262626262626$
$k = \frac{262626262626262626}{37} = 7098007098007098$, $k \in \mathbb{Z}$
$\therefore 37|262626262626262626$

Let k be some number in $37k = 272727272727272727$
$k = \frac{272727272727272727}{37} = 7371007371007371$, $k \in \mathbb{Z}$
$\therefore 37|272727272727272727$

Let k be some number in $37k = 282828282828282828$
$k = \frac{282828282828282828}{37} = 7644007644007644$, $k \in \mathbb{Z}$
$\therefore 37|282828282828282828$

Let k be some number in $37k = 292929292929292929$
$k = \frac{292929292929292929}{37} = 7917007917007917$, $k \in \mathbb{Z}$
$\therefore 37|292929292929292929$

Let k be some number in $37k = 303030303030303030$
$k = \frac{303030303030303030}{37} = 8190008190008190$, $k \in \mathbb{Z}$
$\therefore 37|303030303030303030$

Let k be some number in $37k = 313131313131313131$
$k = \frac{313131313131313131}{37} = 8463008463008463, k \in \mathbb{Z}$
$\therefore 37|313131313131313131$

Let k be some number in $37k = 323232323232323232$
$k = \frac{323232323232323232}{37} = 8736008736008736, k \in \mathbb{Z}$
$\therefore 37|323232323232323232$

Let k be some number in $37k = 333333333333333333$
$k = \frac{333333333333333333}{37} = 9009009009009008, k \in \mathbb{Z}$
$\therefore 37|333333333333333333$

Let k be some number in $37k = 343434343434343434$
$k = \frac{343434343434343434}{37} = 9282009282009282, k \in \mathbb{Z}$
$\therefore 37|343434343434343434$

Let k be some number in $37k = 353535353535353535$
$k = \frac{353535353535353535}{37} = 9555009555009556, k \in \mathbb{Z}$
$\therefore 37|353535353535353535$

Let k be some number in $37k = 363636363636363636$
$k = \frac{363636363636363636}{37} = 9828009828009828, k \in \mathbb{Z}$
$\therefore 37|363636363636363636$

Let k be some number in $37k = 373737373737373737$
$k = \frac{373737373737373737}{37} = 10101010101010100, k \in \mathbb{Z}$
$\therefore 37|373737373737373737$

Let k be some number in $37k = 383838383838383838$
$k = \frac{383838383838383838}{37} = 10374010374010374, k \in \mathbb{Z}$
$\therefore 37|383838383838383838$

Let k be some number in $37k = 393939393939393939$
$k = \frac{393939393939393939}{37} = 10647010647010648, k \in \mathbb{Z}$
$\therefore 37|393939393939393939$

Let k be some number in $37k = 404040404040404040$
$k = \frac{404040404040404040}{37} = 10920010920010920, k \in \mathbb{Z}$
$\therefore 37|404040404040404040$

Let k be some number in $37k = 414141414141414141$

$\therefore \forall 0 \leq c, d \leq 9,\ 37|f_9(c, d)$. $\blacksquare$

Problem 1.4. To ride the PATH train from Newark to New York, you must swipe a metro card that costs \$2.75 per ride. Suppose my friend is moving out of New York and they give me their old metro card that has some amount of money on it, given as M (can be any dollar/cent amount).

Part 1: Suppose every time I refill this card, I only refill with \$20.00 exactly. Assuming that I only refill when I do not have enough left in the card to pay for my next ride, provide and prove all values of M for which the metro card amount will eventually reach 0.

Theorem: The equation $ax + by = c$ has a solution iff $gcd(a, b)|c$.
Let $a = 2.75, \quad b = 20, \quad c = M$
Let $M = 0.25k, \forall k \in \mathbb{Z} \quad gcd(2.75, 20) = 0.25 = d$

Proof: Suppose $gcd(a, b) = d \Rightarrow a = k_1 \cdot d, \ b = k_2 \cdot d, \ k \in \mathbb{Z}$
$$k_1 dx - k_2 dy = c$$
$$k_1 x - k_2 y = \tfrac{c}{d} \qquad (\forall x \text{ and } \forall y \in \mathbb{Z})$$
$\therefore d|c$ $\blacksquare$

Part 2: Suppose instead of paying \$20.00, every time I refill using some amount of money R (represented in **cents**). Prove that so long as R is not divisible by 5 or 11, that the metro card will eventually reach 0 for any value of M.

Theorem: The equation $ax + by = c$ has a solution iff $gcd(a, b)|c$.
$k \in \mathbb{Z}$
Let $a = 5k,\ b = 11k,\ c = M,\ d_1 = 5,\ d_2 = 11$

Since $gcd(2.75, a) = d_1$ and $gcd(2.75, b) = d_2, \quad d_1, d_2 > 1$.
Let $R = \forall r$. That is, $(\overline{a} \wedge \overline{b})$.

Proof: Suppose $gcd(2.75, R) = d, \quad d = 1$
$\quad R = k_1 d, \quad 2.75 = k_2 d, \quad k_1, k_2 \in \mathbb{Z}$
$\quad k_1 dx - k_2 dy = c \qquad \forall x, \forall y \in \mathbb{Z}$
$\quad k_1 x - k_2 y = \tfrac{c}{d}$
$\therefore d|c$ $\blacksquare$
